The presence of zinc ions in the culture medium enhances the process of recombinantly producing the D-aminoacylase to microorganism of the invention also relates to microorganism of the invention. The recombinant microorganism is used synthesis of high optical-purity D-form amino acids for use ful in the production of antibiotics and peptide drugs. The present sequence represents Alcaligenes xylosoxidans subspecies xylosoxidans

                                                                                                                                                                                                                                                                             The present sequence represents an aminocyclase enzyme. The enzyme capable of hydrolysing N-acetyl-D-tryptophan at a substrate concentration of 10 grams per litre, and exhibiting faster converse of R-N-acetyl-2-thienylalanine than of R-N-acetyl-4-chlorophenylalanine. The enzyme can be used for the preparation of a D-amino acid by conversion of a corresponding D-N-acylamino acid. It can also be used for resolving a racemic mixture of N-acylamino acids and deprotecting optically-enriched the production of various pesticides, antibiotics and other harmananticals.
                                                                                                                                                                                                                                                                                                                                                                                                          New isolated D-amino acylase enzyme, useful for the preparation D-amino acids for use as intermediates in the preparation of pesticides, antibiotics and other pharmaceuticals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                       The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi i a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to lid degrees centigrade.

110 degrees centigrade.

Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436.

D-aminoacylase is useful for producing p-amino acids. The enzyme has substrate specificity, thermal stability and produces D-amino acid efficiently by incubating the fungus derived D-aminoacylase with N-acetyl-D-amino acid under proper conditions. The enzyme has high enzymatic activity for N-acetyl-D-tryptophan and is excellent in industrial applicability. The recombinant polypeptide of D-aminoacylase can be manufactured at
